Haul Monitor — Trimble PC*MILER Pricing Analysis

Prepared for: Trimble Partnership Meeting **Date:** March 19, 2026 **Prepared by:** Haul Monitor

---

1. Trimble Proposed Pricing (As Submitted)

Term	Detail
Per-load rate	$0.30 per posted load / per month
Monthly minimum (months 1–6)	$250/month
Monthly minimum (month 7+ / renewals)	$500/month
Reporting obligation	Load count submitted by the 10th of each month
Billing	Credit card for first 6 months; optional Net-30 thereafter

---

2. Why "Posted Load" Doesn't Fit Haul Monitor's Model

Haul Monitor is **not a load board**. We do not originate or post freight.

Our model: dispatchers connect their existing load board accounts (DAT, Truckstop, etc.) and Haul Monitor aggregates available loads from those boards, runs them through PC*MILER's routing engine, and surfaces the best backhaul matches for their route home. The loads already exist elsewhere — we are the intelligence layer on top of them.

This means:

- We have no "posted loads" to count
- Charging us per load in our system would mean paying for inventory we don't own
- At scale, a single popular backhaul lane could have the same load evaluated by hundreds of our users — it should not count as hundreds of billable events

The right pricing unit for an aggregator is the downstream action: a dispatcher selecting a load to haul.

---

3. Proposed Counter-Model: Per Load Selected

The "Haul This Load" Event

Haul Monitor has a built-in confirmation workflow called **"Haul This Load."** When a dispatcher finds a match they want to pursue, they click the button, review the route/financials in a confirmation dialog, and confirm. That event:

- Writes a timestamped record to our database (`completed_at`, `status: completed`, `revenue_amount`, `net_revenue`)

- Is discrete, auditable, and non-gameable — a dispatcher only clicks it when they are genuinely taking the load
- Is exactly the moment PC*MILER's routing intelligence delivered value

This is the event we propose as the billable unit.

Why This Works for Both Parties

	Per Posted Load (Trimble's Proposal)	**Per Load Selected (Haul Monitor Counter)**
Fits Haul Monitor's model	No — we don't post loads	Yes — we track selections natively
Auditable	Requires defining what "in system" means	Yes — timestamped DB record per event
Tied to PC*MILER value delivery	Loosely	Directly — selection follows a PC*MILER match
Fair at scale	No — same load seen by 1,000 users = 1,000 charges	Yes — one charge per dispatcher action
Predictable for Trimble	Variable	Consistent with platform growth

4. Market Basis (TAM)

Segment	**Count**	**Source**
Specialized truck dispatchers (core)	38,000–40,000	Bureau of Labor Statistics
Dedicated truck dispatchers (expanded)	~196,000	Industry estimates
Broader transport/logistics/dispatch roles	200,000+	BLS (related fields)

Working TAM: 39,000 (core/conservative) and 196,000 (expanded)

---

5. Usage Model — Searches vs. Selections

The key distinction in Haul Monitor's workflow is the large gap between loads *evaluated* and loads *selected*.

Parameter	**Assumption**	**Rationale**
Searches per dispatcher per day	10	Active dispatchers managing multiple trucks
Loads evaluated per search	25	Current match cap
Total loads seen per day	250	Before filtering and selection
Loads actually hauled per day	2–5	Realistic for a dispatcher managing a small fleet
Conversion rate (seen → hauled)	**~1–2%**	Dispatcher evaluates many options, commits to few

Parameter	Assumption	Rationale
Hauls per user per month	**~50–110**	22 working days

Working baseline for cost modeling: 50 "Haul This Load" events per active user per month (conservative).

---

6. Cost Projections — Per Load Selected at $0.30

Platform Scale	Active Users	Hauls/User/Mo	Monthly Hauls	Monthly Cost	Annual Cost
Early (pre-launch)	<10	50	<500	**$250** (minimum)	$3,000
Seed growth	~50	50	2,500	**$750**	$9,000
1% core TAM	~390	50	19,500	**$5,850**	$70,200
5% core TAM	~1,950	50	97,500	**$29,250**	$351,000
10% core TAM	~3,900	50	195,000	**$58,500**	$702,000
5% expanded TAM	~9,800	50	490,000	**$147,000**	$1.76M

---

7. Haul Monitor Pricing Model — Credits, Not Subscriptions

Haul Monitor uses a **pay-per-search credit model**. No monthly subscription. Credits never expire.

Bundle	Price	Credits	Cost Per Credit	Savings vs. Starter
Starter	$50	10	**$5.00/credit**	—
Pro *(most popular)*	$75	30	**$2.50/credit**	50%
Fleet	$200	100	**$2.00/credit**	60%

What costs 1 credit:

- Creating and running a backhaul search
- Material change re-run on an open, active backhaul request
- Creating and running an estimate request

Credit Consumption Per Active User Per Month

Usage Level	Searches/Day	Credits/Month	Likely Bundle
Light	1	~22	Starter (×2) or Pro
Moderate	2–3	~50–65	Pro (×2) or Fleet

Usage Level	Searches/Day	Credits/Month	Likely Bundle
Heavy	5	~110	Fleet + top-up

Baseline for modeling: 50 credits/user/month (moderate user, roughly one Pro bundle per month).

---

8. Revenue Margin Implications — Credits vs. Trimble Cost

Revenue Per Credit (by bundle)

Bundle	Revenue/Credit	Trimble Cost/Credit*	Gross Margin
Starter	$5.00	$0.03–$0.30	**94–99%**
Pro	$2.50	$0.03–$0.30	**88–99%**
Fleet	$2.00	$0.03–$0.30	**85–99%**

Trimble cost per credit = $0.30 per haul selected ÷ estimated 1–10 searches per haul conversion rate.

Conversion rate drives Trimble cost: a dispatcher runs multiple searches before committing to a load. At 10% conversion (1 haul per 10 searches), Trimble costs $0.03/credit. At 100% (every search results in a haul), it's $0.30/credit — still only 6–15% of revenue.

Monthly Revenue at Scale (50 credits/user/month, Pro-tier blended at $2.50/credit)

Scenario	Users	Credits/Month	Monthly Revenue	Trimble Cost	Gross Margin
1% core TAM	390	19,500	$48,750	$5,850	**$42,900 (88%)**
5% core TAM	1,950	97,500	$243,750	$29,250	**$214,500 (88%)**
10% core TAM	3,900	195,000	$487,500	$58,500	**$429,000 (88%)**
5% expanded TAM	9,800	490,000	$1,225,000	$147,000	**$1,078,000 (88%)**

> Margins hold consistently at ~88% across all scale scenarios at the Pro tier. The credit model is well-structured: Trimble's cost scales with usage, and our revenue scales with the same usage. There is no margin compression at growth.

---

9. Comparison: Per Load Selected vs. Per Load Evaluated (API Call Equivalent)

To illustrate why the per-selection model is fair and sustainable — and why a per-call or per-evaluation model would be punishing for an aggregator:

Per-User Monthly API Activity

Parameter	Value
Fresh (uncached) searches/day	4 (of 10 total; 60% cache hit rate)
Loads evaluated per fresh search	25
Route Report calls per evaluation	2 (datum→pickup + delivery→home)
Route Report calls/user/day	**200**
Route Report calls/user/month	**~4,400**

Monthly API Call Volume vs. Monthly Selections

Scenario	Users	API Calls/Month	Load Selections/Month	Ratio
1% core TAM	390	1.7M	19,500	87:1
5% core TAM	1,950	8.6M	97,500	88:1
10% core TAM	3,900	17.2M	195,000	88:1
5% expanded TAM	9,800	43M	490,000	88:1

For every load a dispatcher hauls, Haul Monitor makes ~88 PC*MILER API calls. The per-selection model prices the outcome; the per-call model prices the work. Trimble should prefer the outcome model — it scales with our success and is immune to caching optimizations on our end.

---

10. Key Questions / Negotiating Points for the Meeting

1. **Challenge the "posted load" framing** — We are an aggregator, not a load board. Propose "per load selected" as the billing unit and explain the "Haul This Load" tracking mechanism.
2. **Get the tier breakpoints** — Trimble mentioned discounted tiers. At what monthly selection volume do rates drop, and to what? This shapes our growth economics.
3. **Confirm what's auditable** — We can export monthly haul counts from our database by the 10th of each month. Does Trimble want raw counts, or load IDs/timestamps? We can provide either.
4. **API rate limits** — We generate bursts of up to 50 parallelized calls per dispatcher search. Confirm no burst throttling that would degrade the UX.
5. **Relay loads** — Our relay mode evaluates a different route geometry. Do relay hauls count the same as standard hauls?
6. **Lock in the rate** — Whatever rate is agreed, negotiate the right to drop to a lower tier as volume grows without renegotiating the full agreement.
7. **Multi-board users** — If a dispatcher connects DAT and Truckstop, and the same load appears on both, a single "Haul This Load" event fires once. Confirm this counts as one billable event, not two.

---

11. Summary

Trimble's proposed unit	Per posted load/month

Haul Monitor's proposed unit	**Per load selected ("Haul This Load" event)**
Why the change	Haul Monitor is an aggregator — we don't post loads
Tracking mechanism	Built — timestamped DB record on dispatcher confirmation
Haul Monitor pricing	Credit bundles: $50/10 credits · $75/30 credits · $200/100 credits
Revenue per credit (Pro)	$2.50
Minimum cost	$250/mo (yr 1), $500/mo (yr 2+)
Trimble cost per credit	$0.03–$0.30 (varies by search-to-haul conversion rate)
Gross margin after Trimble	~88% at Pro tier, across all scale scenarios
API calls per haul selected	~88 (demonstrates value of outcome-based pricing)
Verdict	Credit model + per-selection Trimble pricing = consistent ~88% margins at every scale

Assumptions: 22 working days/month, 10 searches/dispatcher/day, 40% cache miss rate, 25 load candidates/search, 2 Route Report calls/load, 50 "Haul This Load" events/user/month.
